

		Project Change Request (PCR)	Client	Design World
			Doc #	FPCC-PCR-001
Effective Date	06/08/26		Rev. #	Rev 1

Summary Description

The proposed change will harden the Design World Windows Server 2022 Domain Controller, DW-DC-OL-1, by applying missing security updates and correcting configuration weaknesses confirmed during the Vulnerability Assessment and Penetration Test. This change focuses on reducing the risk of unauthorized access, privilege escalation, credential compromise, and improper trust of modified signed files.

Proposed Change

1. Patch Application and Security Update Installation

- Apply missing Windows Server 2022 security updates.
- Confirm that required updates are successfully installed.
- Reboot during the approved maintenance window if required.

2. Authentication and Signature Validation Hardening

- Disable legacy LM and NTLMv1 authentication.
- Enforce NTLMv2 and Kerberos where applicable.
- Enable WinVerifyTrust signature validation mitigation.

3. Service Permission Review

- Review insecure Windows service permissions.
- Correct weak discretionary access control lists.
- Validate that low-privileged users cannot modify service behavior.

Reason for Change

The Domain Controller supports centralized authentication and access control for Design World's environment. Weak authentication settings, missing updates, and insecure service permissions increase the risk of credential attacks, unauthorized access, and privilege escalation. Applying this change will reduce the likelihood that an attacker can compromise identity services or use the Domain Controller as a path to access other systems.

Effective Date	06/08/26		Rev. #	Rev 1

Impact Analysis

Expected Benefits

1. **Mitigated Vulnerabilities:** Applying missing updates and correcting insecure settings will reduce the risk of exploitation against the Domain Controller.
2. **Improved Authentication Security:** Disabling LM and NTLMv1 will reduce exposure to legacy authentication attacks.
3. **Reduced Privilege Escalation Risk:** Correcting insecure service permissions will limit the ability of lower-privileged users to manipulate services.

Potential Risks and Mitigations

The proposed changes may require a system restart and could affect legacy authentication compatibility. To reduce disruption, the changes will be performed during an approved maintenance window. A system snapshot or backup will be available before implementation, and authentication functionality will be tested after the change.
